

Chapter 10

Trees

Objectives

- 10.1- Introduction to Trees
- 10.2- Applications of Trees
- 10.3- Tree Traversal

10.1- Introduction to Trees

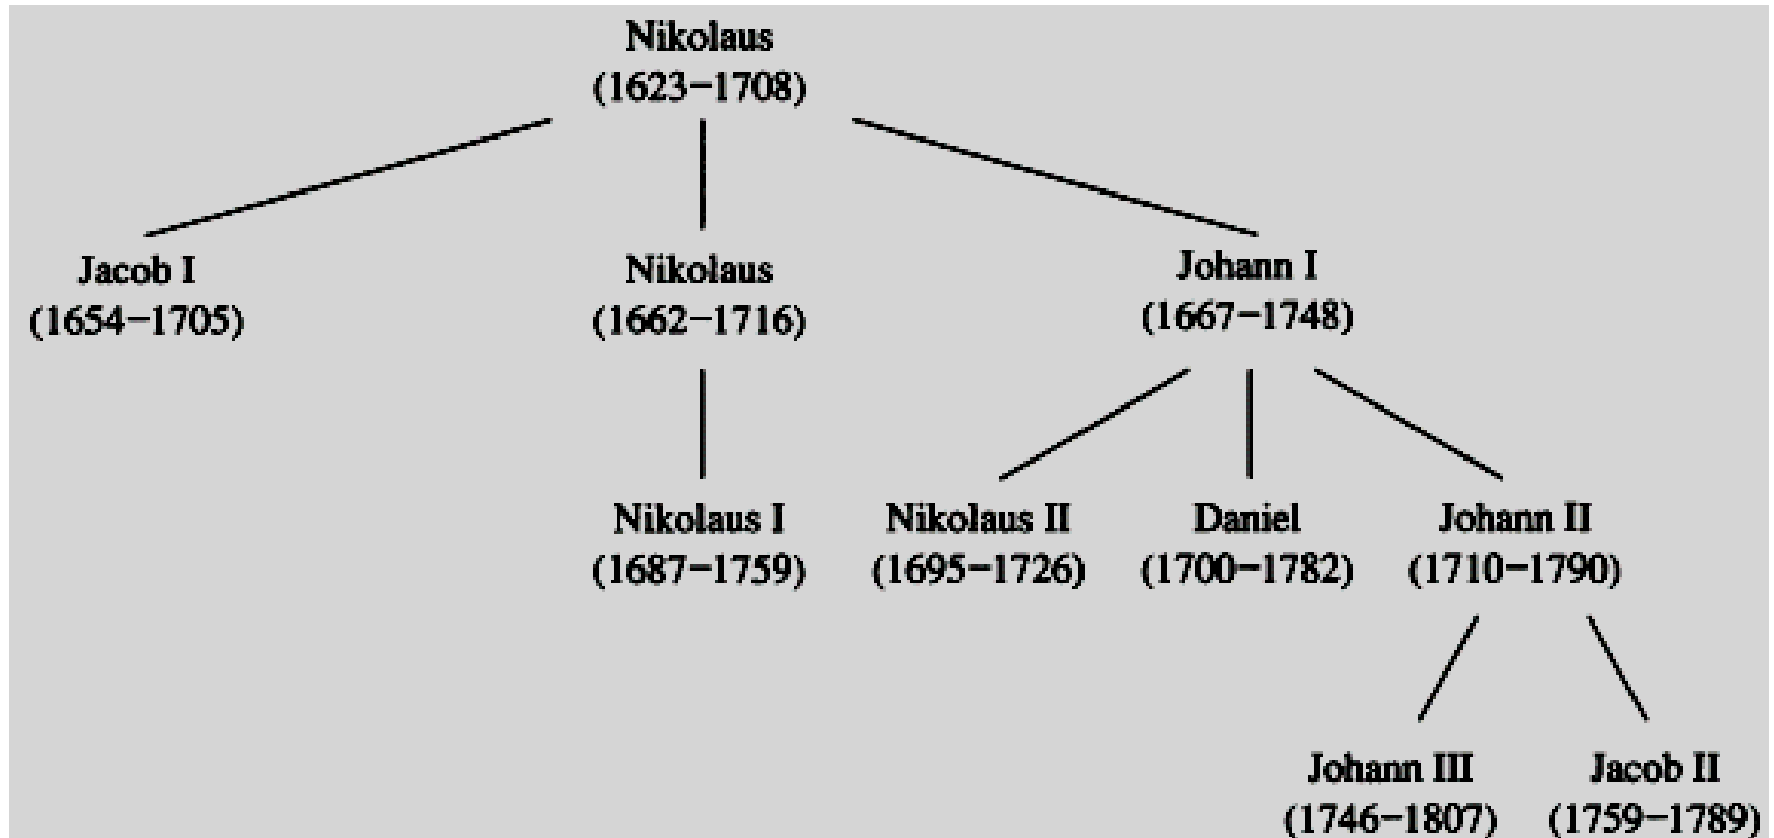

FIGURE 1 The Bernoulli Family of Mathematicians.

Introduction to Trees...

FIGURE 3 Example of a Forest.

Introduction to Trees

DEFINITION 1

A tree is a connected undirected graph with no simple circuits.

FIGURE 2 Examples of Trees and Graphs That Are Not Trees.

Introduction to Trees...

THEOREM 1 Proof: page 684

An undirected graph is a tree if and only if there is a unique simple path between any two of its vertices.

DEFINITION 2

A *rooted tree* is a tree in which one vertex has been designated as the root and every edge is directed away from the root.

FIGURE 4 A Tree and Rooted Trees Formed by Designating Two Roots.

Introduction to Trees...

FIGURE 5 A Rooted Tree T .

FIGURE 6 The Subtree Rooted at g .

$$n = i + 1$$

Some terminologies:

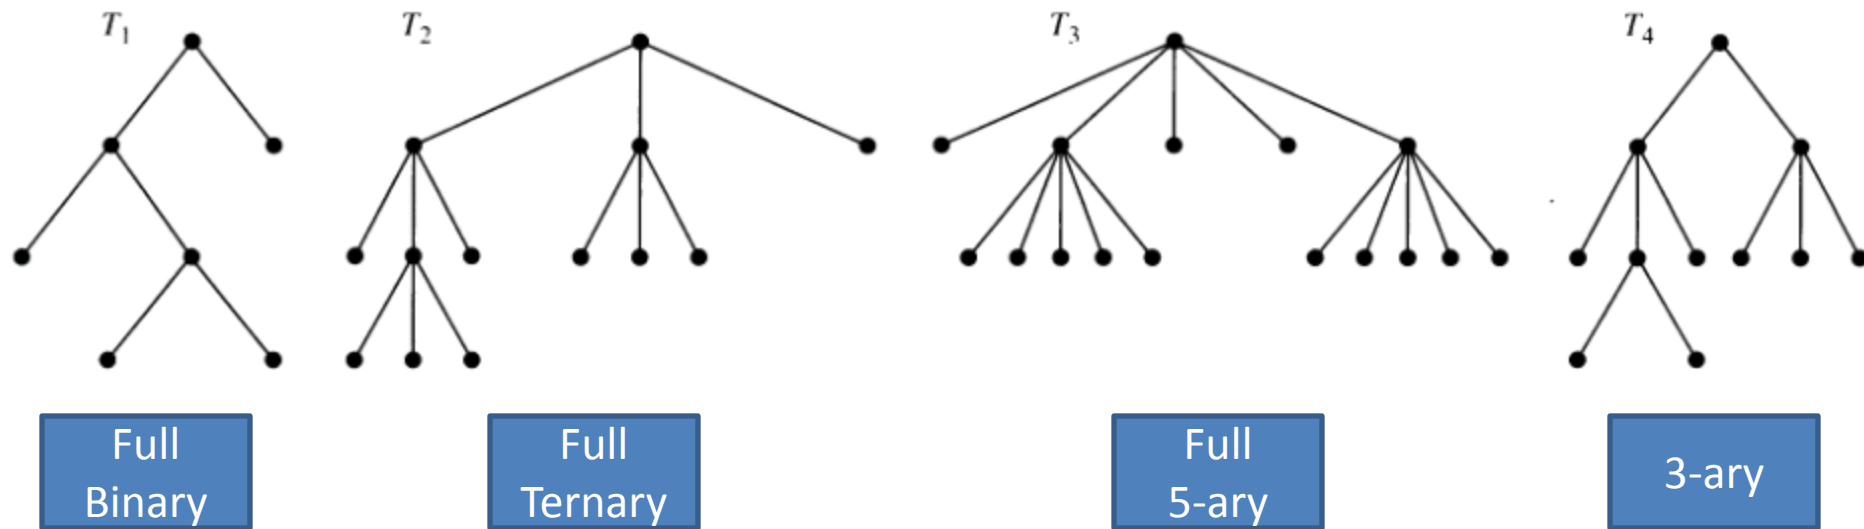

Page 686

Subtree
Root node (vertex)
Internal node
Leaf
Parent
Child
Siblings
Descendants
Ancestors

Introduction to Trees...

DEFINITION 3

A rooted tree is called an *m*-ary tree if every internal vertex has no more than *m* children. The tree is called a *full m*-ary tree if every internal vertex has exactly *m* children. An *m*-ary tree with $m = 2$ is called a *binary tree*.

Some terminologies on binary tree:

Left child, right child, left subtree, right subtree

Introduction to Trees...

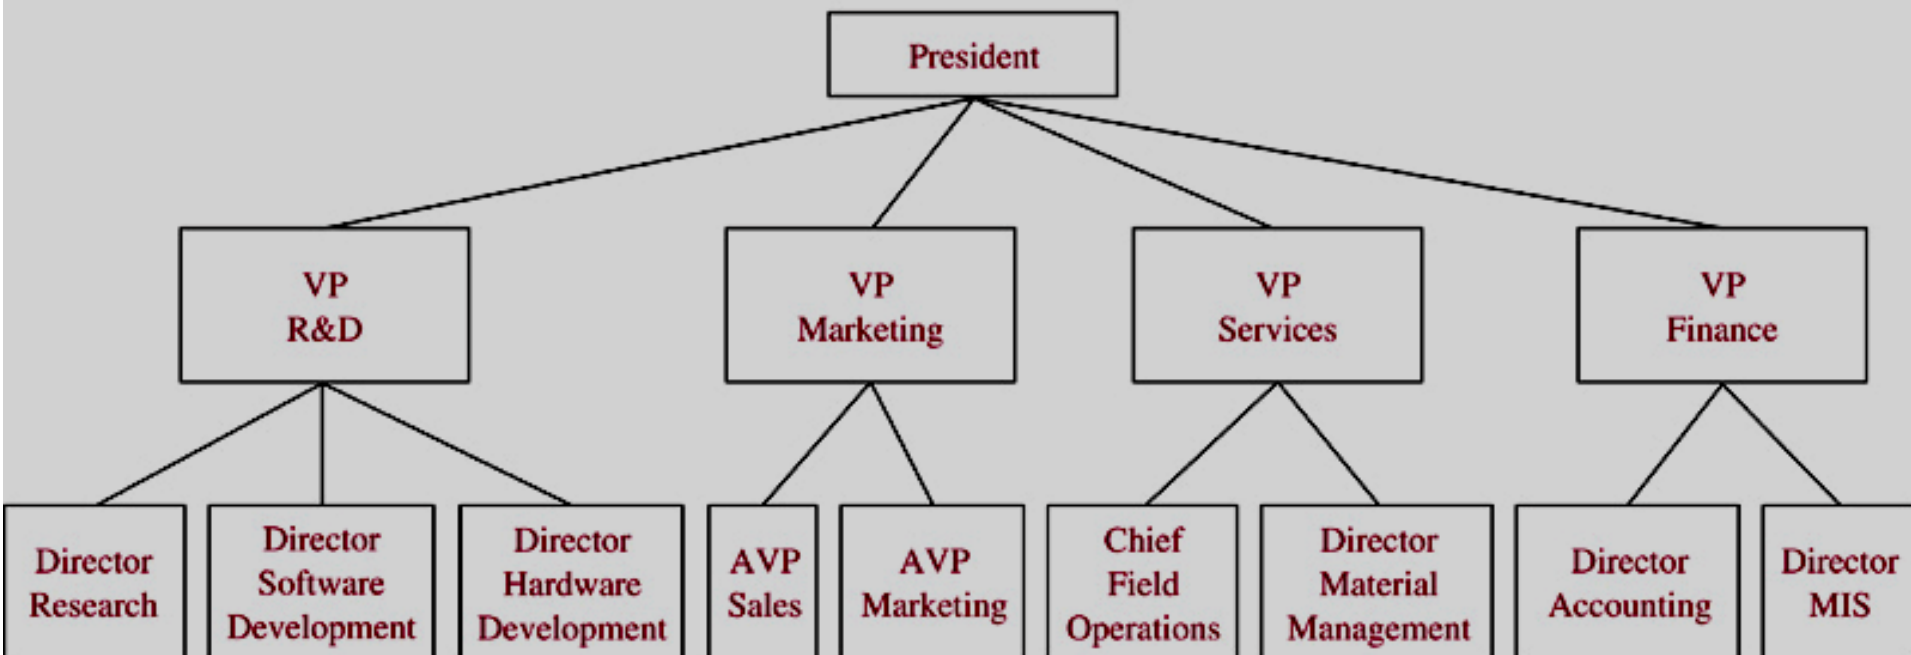

FIGURE 8 A Binary Tree T and Left and Right Subtrees of the Vertex c .

Properties of Trees

THEOREM 2

A tree with n vertices has $n - 1$ edges.

Using Mathematic Induction.

Let n_E be number of edges.

$P(n)$: If the tree T having n vertices then $n_E = n - 1$

Basic step:

$P(1)$: $n=1$, tree has the root node only $\rightarrow n_E = 0 = n - 1 \rightarrow P(1)$ true

Induction step:

Suppose that $P(k)$ is true for all $k \geq 1$, ie $n_E = k - 1$

Add a leaf vertex v to the tree T so that T having $k+1$ vertices still is a tree.

Let w be the parent of v .

Because T is connected and has no simple circuit \rightarrow there is only one new edge between u and $v \rightarrow n_E = (k-1) + 1 = k$.

$\rightarrow P(k+1)$ true

Proved.

$$e = n - 1$$

Introduction to Trees...

THEOREM 3

A full m -ary tree with i internal vertices contains $n = mi + 1$ vertices.

$$m=3$$

$$i=4$$

$$n = 3 \cdot 4 + 1 = 13$$

$$m=5$$

$$i=3$$

$$n = 5 \cdot 3 + 1 = 16$$

$$n = mi + 1$$

Introduction to Trees...

THEOREM 4

A full m -ary tree with

- (i) n vertices has $i = (n - 1)/m$ internal vertices and $l = [(m - 1)n + 1]/m$ leaves,
- (ii) i internal vertices has $n = mi + 1$ vertices and $l = (m - 1)i + 1$ leaves,
- (iii) l leaves has $n = (ml - 1)/(m - 1)$ vertices and $i = (l - 1)/(m - 1)$ internal vertices.

$$m=3$$

$$n=13$$

$$i=12/3=4$$

$$l = [(3-1)13+1]/3=9$$

$$m=5$$

$$n=16$$

$$i = 15/5=3$$

$$l = (4.16+1)/5= 13$$

Introduction to Trees...

- **Level of a vertex:** The length of the path from the root to this vertex.
- **Height of Tree:** The maximum of levels of vertices = The length of the longest path from the root to any vertex.

Introduction to Trees...

A m-ary tree is called **balanced** if all leaves are at levels h or $h-1$.

$$l \leq m^h \longrightarrow h \geq \log_m l$$

h_{\min}

$h=4$
All leafs are at levels
3, 4
→ Balanced

$h=4$
All leafs are at levels
2, 3, 4
→ Not Balanced

$h=3$
All leafs are at levels
3
→ Balanced

Introduction to Trees...

THEOREM 5: (Proof: page 692)

There are at most m^h leaves in an m -ary tree of height h .

COROLLARY 1

Proof: page 693

If an m -ary tree of height h has l leaves, then $h \geq \lceil \log_m l \rceil$. If the m -ary tree is full and balanced, then $h = \lceil \log_m l \rceil$. (We are using the ceiling function here. Recall that $\lceil x \rceil$ is the smallest integer greater than or equal to x .)

10.2- Applications of Trees

- Binary Search Trees
- Decision Trees
- Prefix Codes

Constructing a Binary Search Tree

Construct a binary search tree for numbers: 23, 16, 43, 5, 9, 1, 6, 2, 33, 27.

Algorithm for inserting an element to BST

ALGORITHM 1 Locating and Adding Items to a Binary Search Tree.

procedure *insertion*(T : binary search tree, x : item)

$v := \text{root of } T$

{a vertex not present in T has the value *null* }

while $v \neq \text{null}$ and $\text{label}(v) \neq x$

begin

if $x < \text{label}(v)$ **then**

if left child of $v \neq \text{null}$ **then** $v := \text{left child of } v$

else add *new vertex* as a left child of v and set $v := \text{null}$

else

if right child of $v \neq \text{null}$ **then** $v := \text{right child of } v$

else add *new vertex* as a right child of v to T and set $v := \text{null}$

end

if root of $T = \text{null}$ **then** add a vertex v to the tree and label it with x

else if v is null or $\text{label}(v) \neq x$ **then** label *new vertex* with x and let v be this new vertex

{ $v = \text{location of } x$ }

Complexity: $O(\log n)$

Proof: page 698

Decision Trees

The Counterfeit Coin Problem

Decision Trees:

Sorting based on Binary Comparisons

FIGURE 4 A Decision Tree for Sorting Three Distinct Elements.

THEOREM 1

A sorting algorithm based on binary comparisons requires at least $\lceil \log n! \rceil$ comparisons.

COROLLARY 1

The number of comparisons used by a sorting algorithm to sort n elements based on binary comparisons is $\Omega(n \log n)$.

THEOREM 2

The average number of comparisons used by a sorting algorithm to sort n elements based on binary comparisons is $\Omega(n \log n)$.

Prefix Codes

- Introduction to Prefix Codes
- Huffman Coding Algorithm

Prefix Codes: Introduction

- English word “sane” is stores 1 byte/character
→ 4-byte memory block is needed (32 bits).
- There are 26 characters → We can use 5 bit only to store a character ($2^5=32$)
- The word “sane” can be stored in 20 bits
- May we can store this word in fewer bit?

Prefix Codes: Introduction

- Construct a binary tree with a prefix code.

- “sane” will be store as
11111011100 → 11 bits

11111011100 : s

11111011100 : a

11111011100 : n

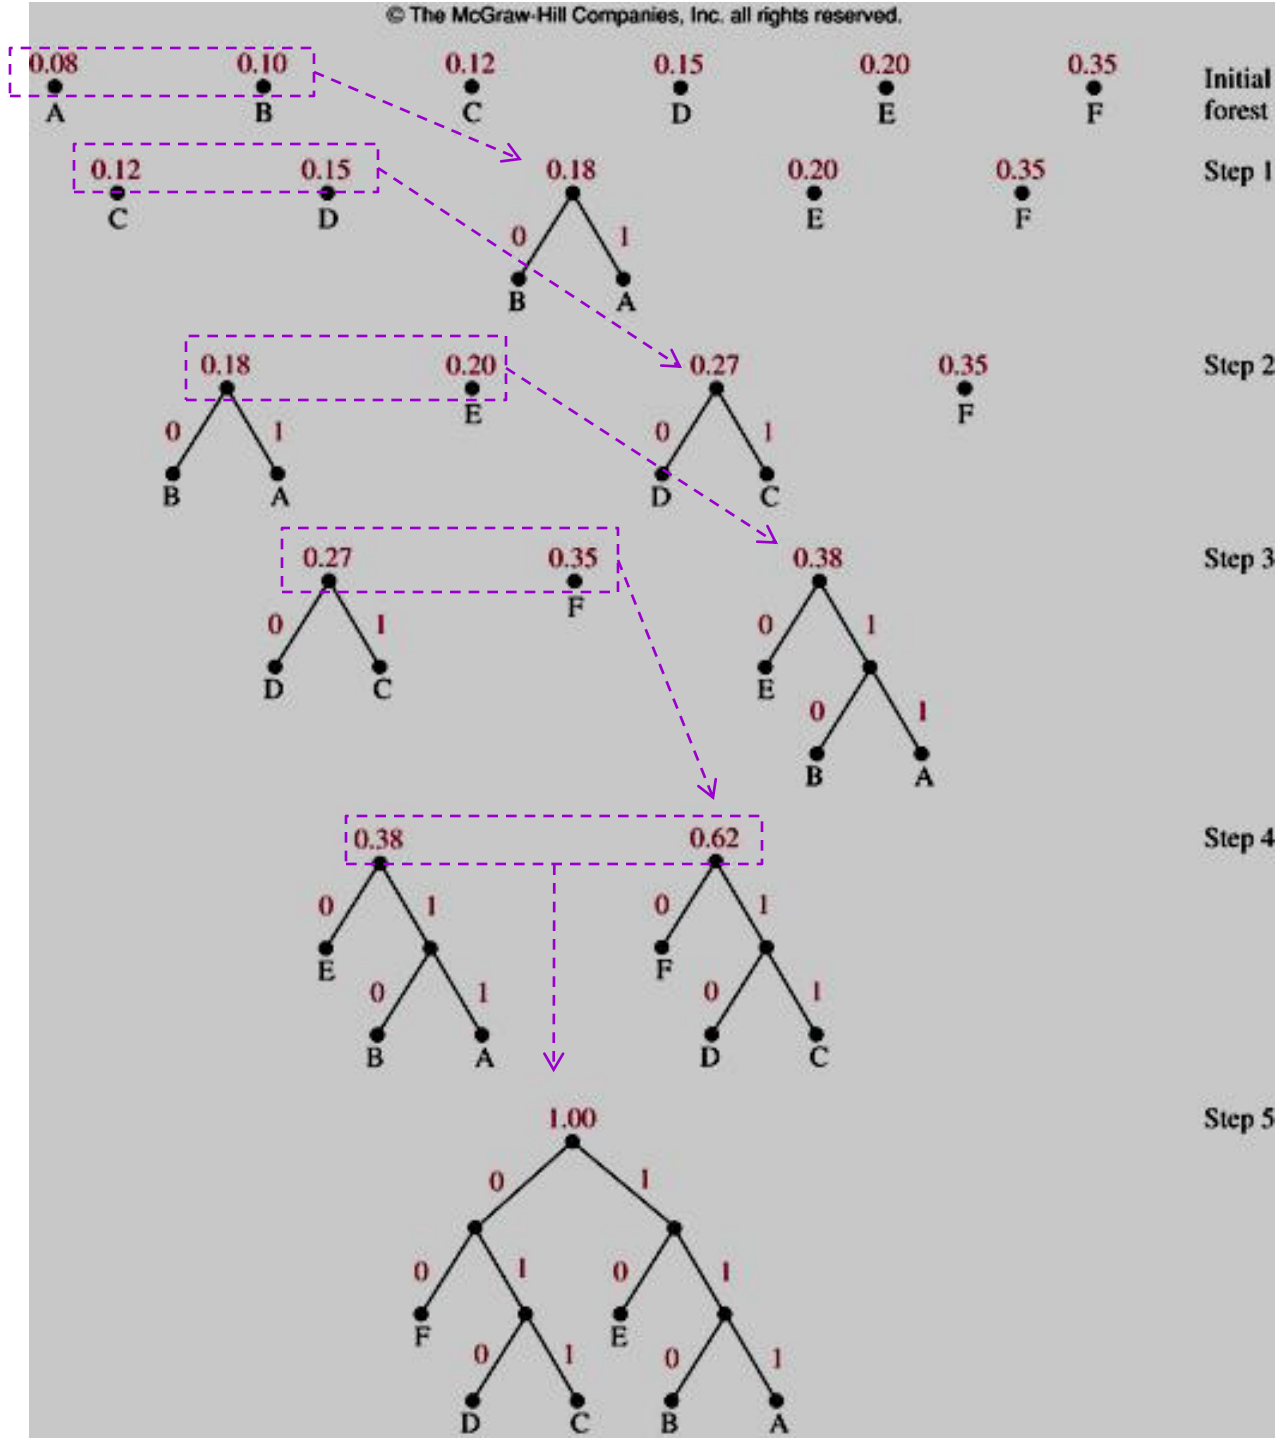

11111011100 : e

→ Compression factor: $32/11 \sim 3$

Prefix Codes: Huffman Coding Algorithm

- Counting occurrences of characters in a text → frequencies (probabilities) of each character.
- Constructing a binary tree representing prefix codes of characters.
- The set of binary codes representing each character.
- Coding source text

**Prefix
Codes:
Huffman
Coding
Algorithm**

Prefix Codes: Huffman Coding Algorithm

ALGORITHM 2 Huffman Coding.

procedure *Huffman*(C : symbols a_i with frequencies $w_i, i = 1, \dots, n$)

$F :=$ forest of n rooted trees, each consisting of the single vertex a_i and assigned weight w_i

while F is not a tree

begin

Replace the rooted trees T and T' of least weights from F with $w(T) \geq w(T')$ with a tree having a new root that has T as its left subtree and T' as its right subtree. Label the new edge to T with 0 and the new edge to T' with 1.

Assign $w(T) + w(T')$ as the weight of the new tree.

end

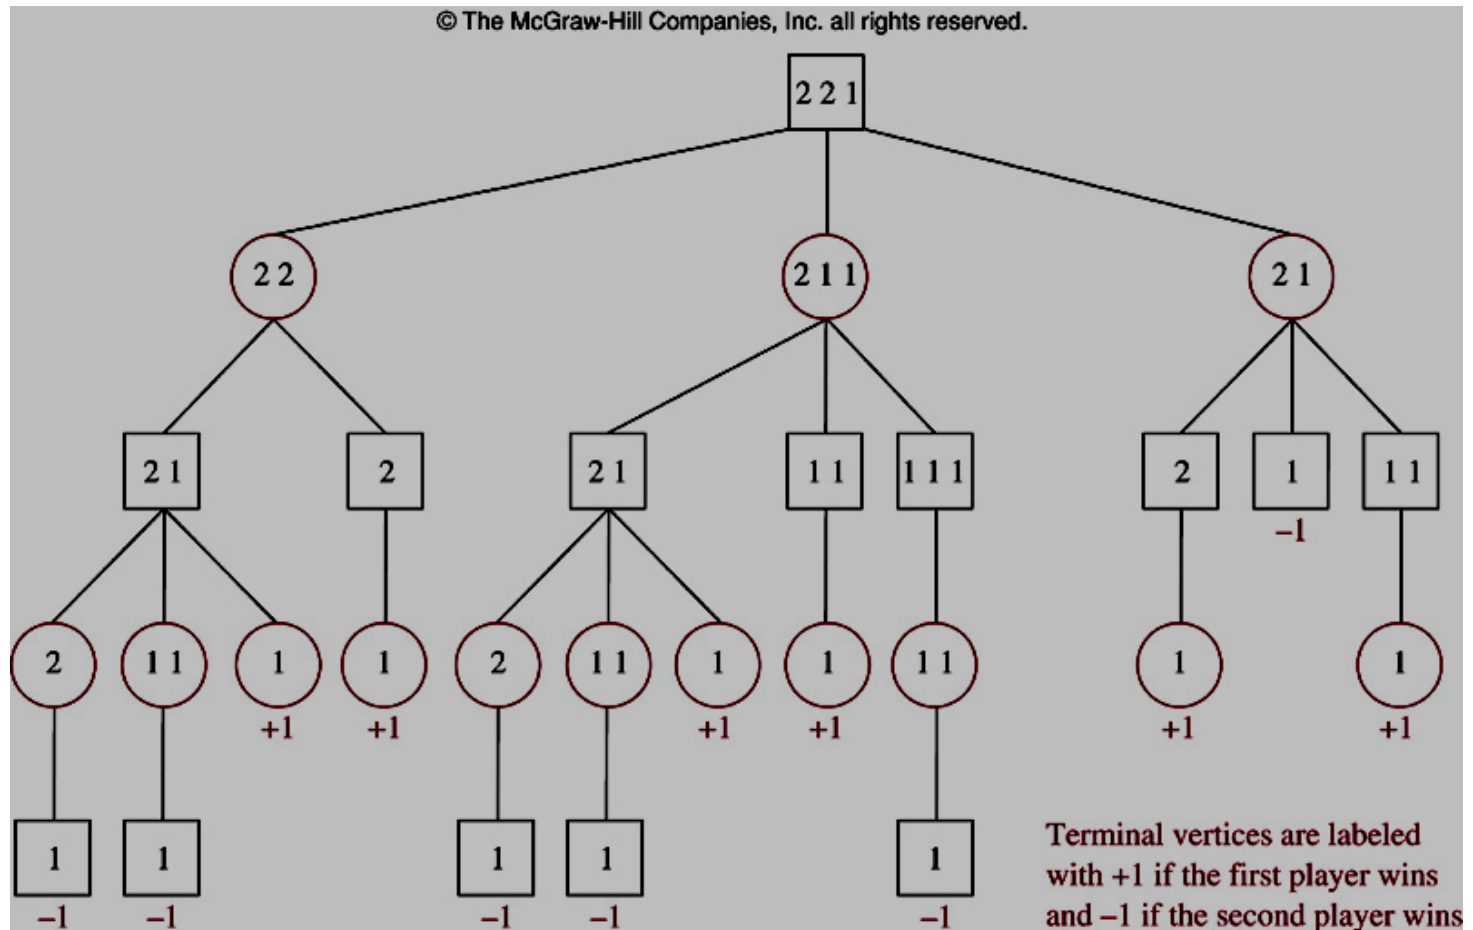

{the Huffman coding for the symbol a_i is the concatenation of the labels of the edges in the unique path from the root to the vertex a_i }

Game Trees: The Game Nim

There are some piles of stones (ex: 2,2,1).

Two players will take turns picking stones from one pile.

The player picks the last stones is loser.

Game Trees : Tic-tac-toe

(a)

(b)

Game Trees...

DEFINITION 1

The value of a vertex in a game tree is defined recursively as:

- (i) the value of a leaf is the payoff to the first player when the game terminates in the position represented by this leaf.**
- (ii) the value of an internal vertex at an even level is the maximum of the values of its children, and the value of an internal vertex at an odd level is the minimum of the values of its children.**

THEOREM 3

The value of a vertex of a game tree tells us the payoff to the first player if both players follow the minmax strategy and play starts from the position represented by this vertex.

Traversal Algorithms

- At a time, a vertex is visited
- Operations are done:
 - Process the visited vertex, e.g. list it's information
 - Traversing recursively subtree.
- Bases on orders of tasks, traversals are classified into:
 - Preorder traversal. N L R
 - Inorder traversal. L N R
 - Postorder traversal. L R N

10.3- Tree Traversal

- Traversal a tree: A way to visit all vertices of the rooted tree.
 - Universal Address Systems
 - Traversal Algorithms
 - Infix, Prefix, and Postfix Notation

Universal Address Systems

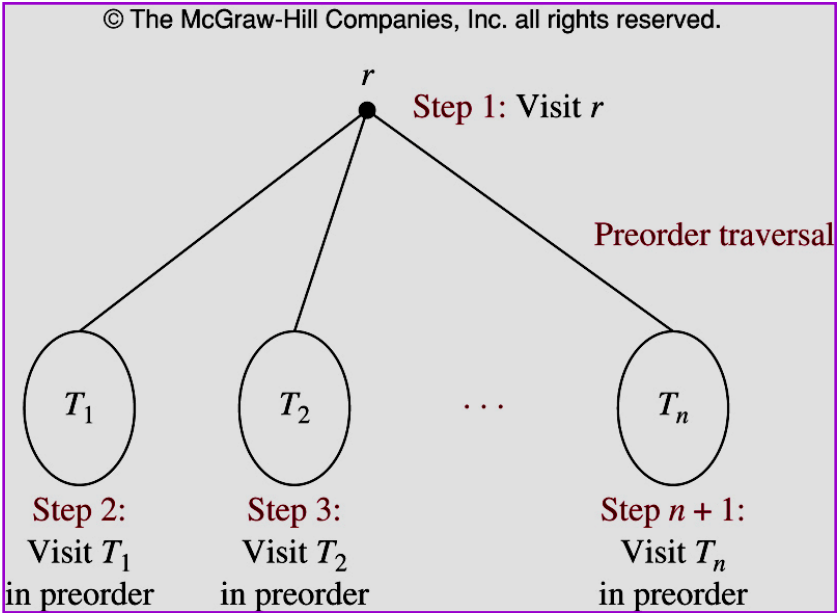

1. Label the root with the integer 0. Then label its k children (at level 1) from left to right with $1, 2, 3, \dots, k$.
2. For each vertex v at level n with label A , label its k_v children, as they are drawn from left to right, with $A.1, A.2, \dots, A.k_v$.

Preorder Traversal

DEFINITION 1

Let T be an ordered rooted tree with root r . If T consists only of r , then r is the *preorder traversal* of T . Otherwise, suppose that T_1, T_2, \dots, T_n are the subtrees at r from left to right in T . The *preorder traversal* begins by visiting r . It continues by traversing T_1 in preorder, then T_2 in preorder, and so on, until T_n is traversed in preorder.

a, b, e, f, c, d, g, h, i

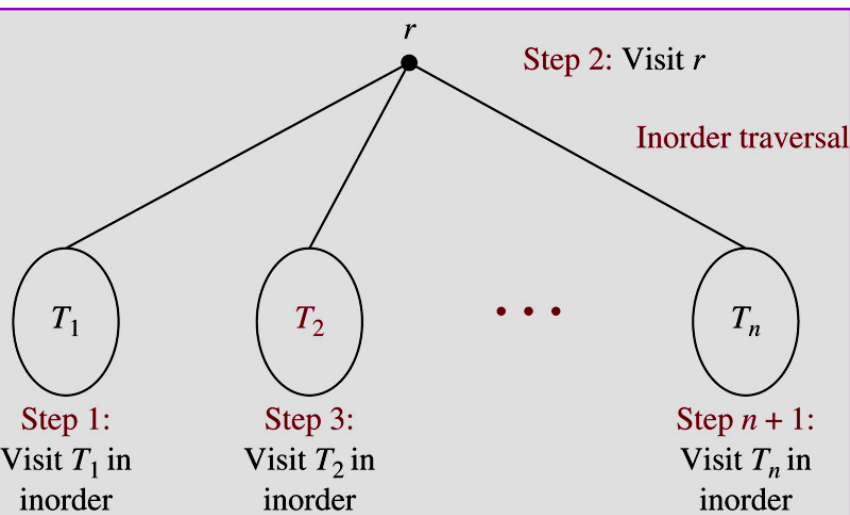

?

Inorder Traversal

DEFINITION 2

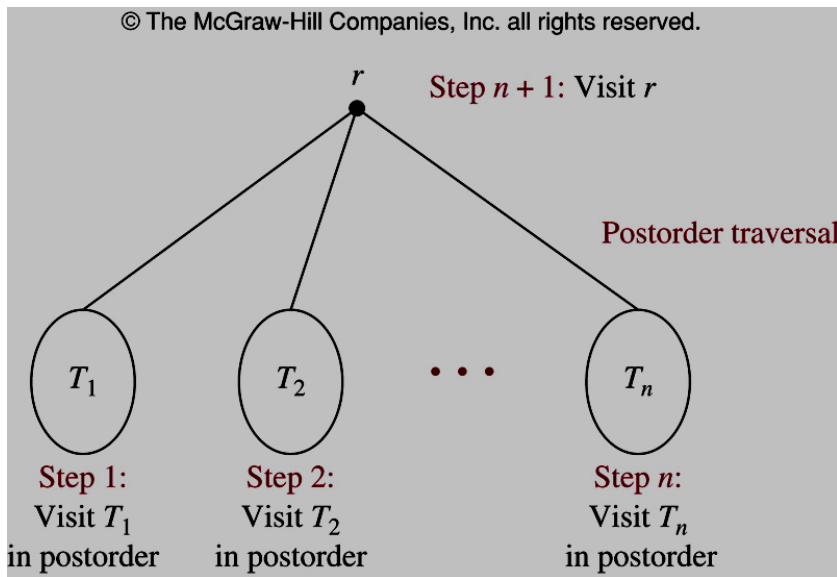

Let T be an ordered rooted tree with root r . If T consists only of r , then r is the *inorder traversal* of T . Otherwise, suppose that T_1, T_2, \dots, T_n are the subtrees at r from left to right. The *inorder traversal* begins by traversing T_1 in inorder, then visiting r . It continues by traversing T_2 in inorder, then T_3 in inorder, \dots , and finally T_n in inorder.

Postorder Traversal

DEFINITION 3

Let T be an ordered rooted tree with root r . If T consists only of r , then r is the *postorder traversal* of T . Otherwise, suppose that T_1, T_2, \dots, T_n are the subtrees at r from left to right. The *postorder traversal* begins by traversing T_1 in postorder, then T_2 in postorder, \dots , then T_n in postorder, and ends by visiting r .

Traverse Algorithms

ALGORITHM 1 Preorder Traversal.

```

procedure preorder(T: ordered rooted tree)
  r := root of T
  list r
  for each child c of r from left to right
  begin
    T(c) := subtree with c as its root
    preorder(T(c))
  end
  
```

ALGORITHM 2 Inorder Traversal.

```

procedure inorder(T: ordered rooted tree)
  r := root of T
  if r is a leaf then list r
  else
    begin
      l := first child of r from left to right
      T(l) := subtree with l as its root
      inorder(T(l))
      list r
      for each child c of r except for l from left to right
        T(c) := subtree with c as its root
        inorder(T(c))
    end
  
```

ALGORITHM 3 Postorder Traversal.

```

procedure postorder(T: ordered rooted tree)
  r := root of T
  for each child c of r from left to right
  begin
    T(c) := subtree with c as its root
    postorder(T(c))
  end
  list r
  
```

Infix, Prefix, and Postfix Notation
